(54) COMPOSITION FOR CRACKING FOAM

(57)Abstract:

PROBLEM TO BE SOLVED: To obtain a composition for cracking foam without necessity of shaking a container just prior spraying, free from anxiety about freezing of a foam film in continuous spraying and having no necessity of formulating a thickener.

SOLUTION: This composition for cracking foam is filled in an aerosol container as an O/W type emulsion comprising an abundant stoke liquid and a propellant. The stock liquid includes water, a surfactant, an oily component and a lower alcohol as essential components and, if necessary, a water-soluble or oil soluble functional component. The surfactant is a mixture comprising a low HLB(hydrophilic-lipophilic balance) surfactant of $HLB \leq 10$ and a high HLB surfactant of $HLB \geq 11$ and difference of the HLB of the both is 9-18 and mainly composed of the former.
